# *Project Overview*

## **Brief Description:**

CampusExpense Manager is a mobile application designed to help university students track expenses, set budgets, and analyze spending habits.

## **Goals:**

Simplify personal financial management, promote responsible spending, and provide actionable insights.

## **Target Audience:**

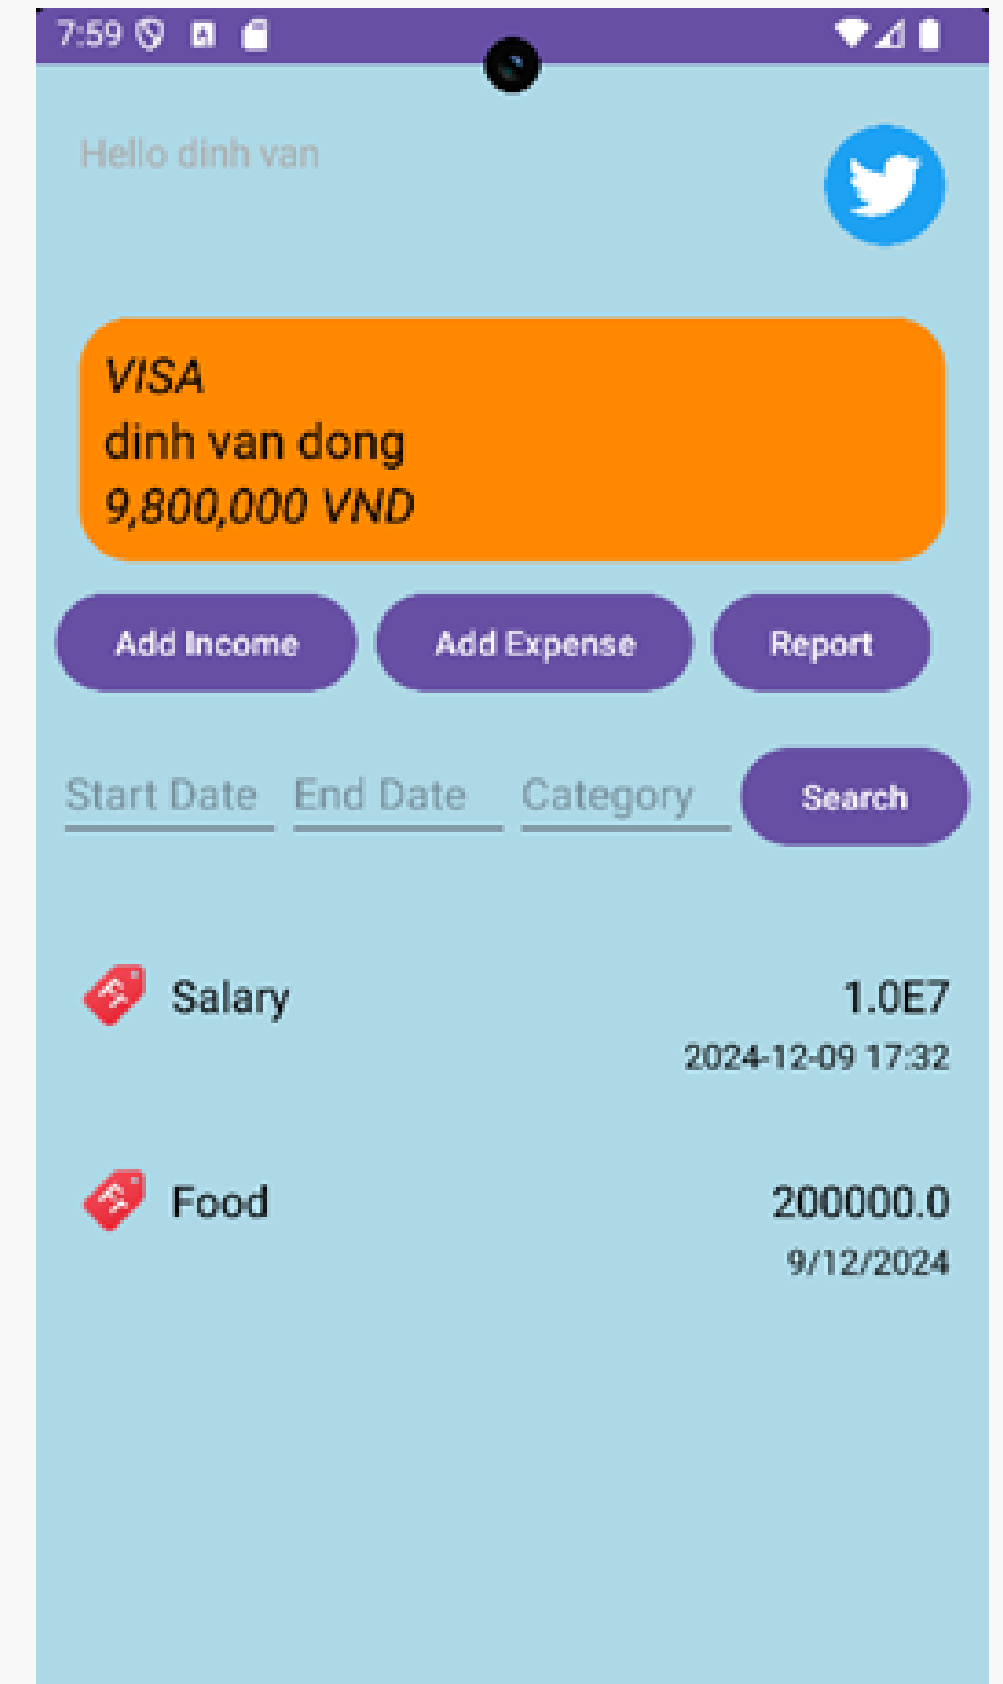

University students managing their finances independently.

# Objectives of the App

- Track and categorize expenses (e.g., rent, groceries).
- Set and monitor budgets for various categories.
- Provide an intuitive user interface for ease of use.
- Enable offline access to support students in low-connectivity areas.

# *User Requirements*

- Key user needs identified during analysis:
- Expense tracking and categorization.
- Notifications for budget limits.
- Intuitive and user-friendly interface.
- Summary reports and spending analytics.

# *Systems Investigation and Research*

## **Research Phase:**

Competitor apps lack offline functionality, simplicity, and are too ads.

---

## **Insights Collected:**

Students prefer straightforward, lightweight tools for tracking finances.

---

## **Priority Features:**

Offline mode, easy data entry, real-time budget monitoring.

---

# *Project Scope and Constraints*

---

## **Scope:**

- Core Features: Expense tracking, budget setting, and notifications.
- Secondary Features: Spending trends, summary reports.

## **Constraints:**

- Limited team experience in mobile app development.
- Strict 12-week development timeline.

# *Tools and Technologies Used*

## Programming Language:

Java

---

## Database:

SQLite (local data storage for offline mode)

---

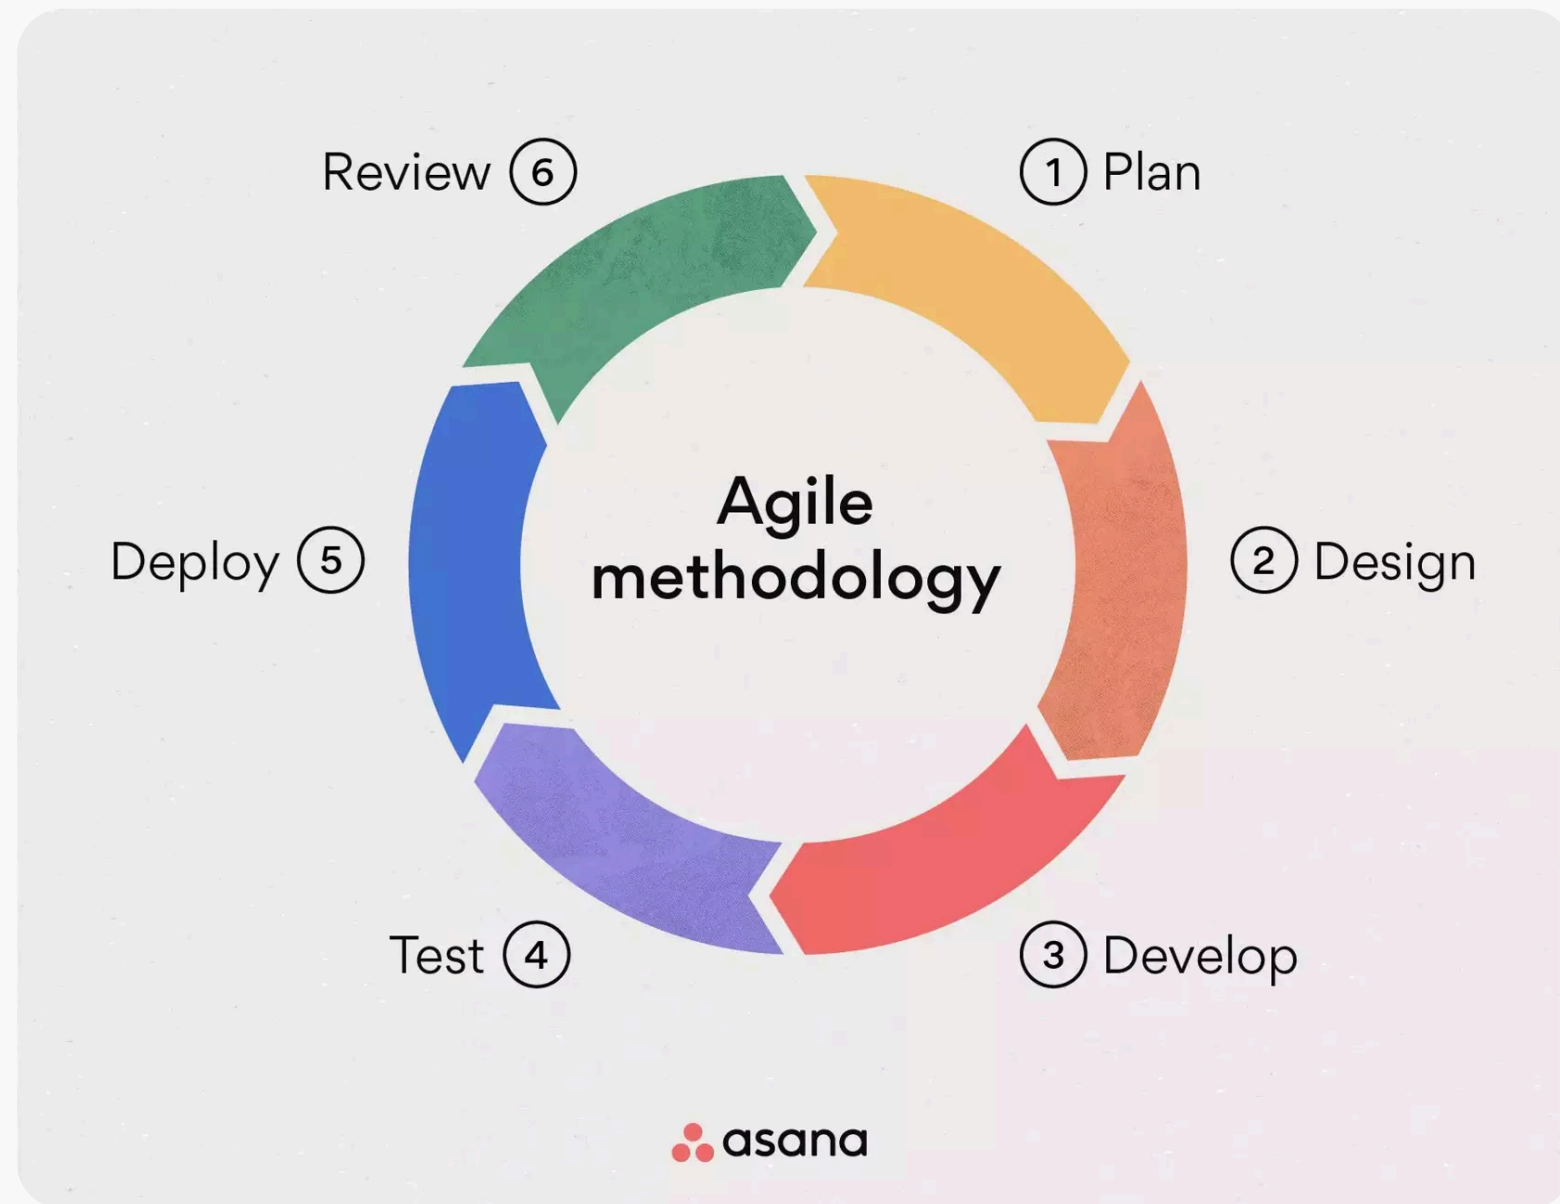

## Development Environment:

Android Studio

---

# Development Methodology

---

## Methodology Chosen: Agile

- Iterative development with weekly sprints.
- Regular feedback from team and stakeholders.

## Why Agile?

- Flexibility to adapt to changes.
  - Continuous testing and improvement during development.
-

# *Initial Design and Prototyping*

## **Process:**

- Created wireframes using Figma.
- Focused on a minimalist and clean layout.

## **Feedback:**

- Students suggested larger buttons for easier input and clearer category labels.

# *User Interface (UI) Design*

## **Design Principles:**

- Simplicity: Minimal clicks to add expenses.
- Consistency: Uniform design across all screens.

## **Example Screenshots:**

-  Login Screen
-  Expense Entry,
-  Summary Dashboard.

# *Backend Architecture*

- SQLite Database:

Used for offline data storage.

- Data Flow:

User inputs → Processed in Java →  
Stored in SQLite.

- Scalability:

Future potential to sync with a cloud-based server.

# *Core Features Implemented*

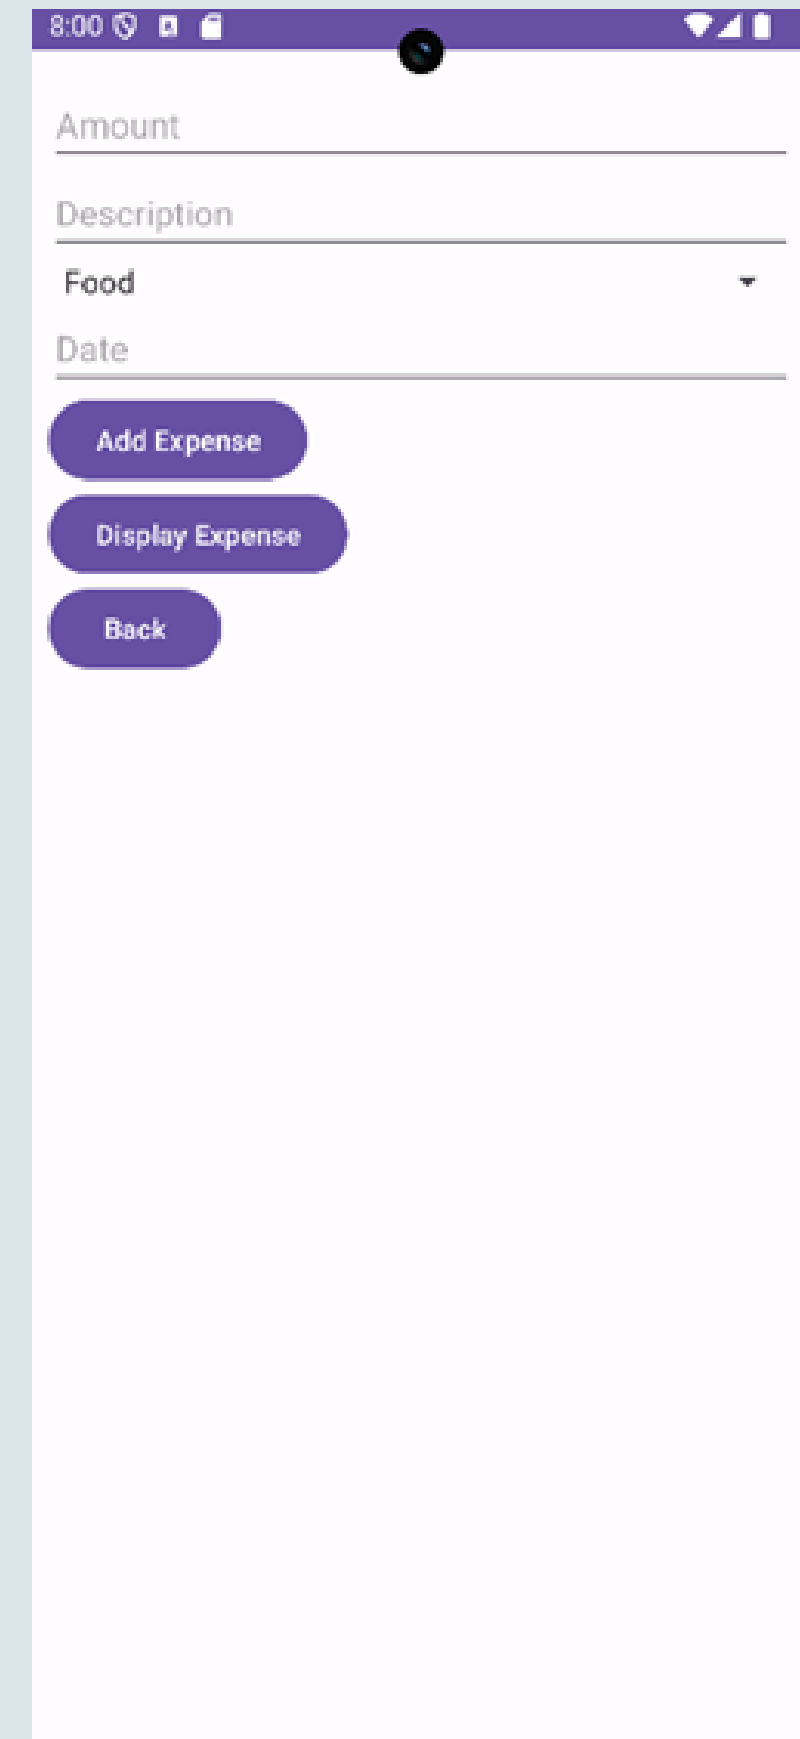

- Expense Logging: Add, edit, and delete expenses.
- Budget Monitoring: Set monthly budgets with notifications for overspending.
- Summary View: Visual breakdown of spending by category.

# *Additional Features*

- Manual Categorization: Users can create and edit expense categories.
- Spending Alerts: Notifications when a category approaches its budget.
- Prioritization: Based on user feedback, these features were secondary to core functionalities.

A mobile application interface for adding an expense. The screen has a white background with a purple header bar at the top. The header bar contains the time '8:00' and several status icons on the left, and a camera icon and signal/battery icons on the right. Below the header, there are four input fields, each with a label and a horizontal line: 'Amount', 'Description', 'Food' (with a dropdown arrow on the right), and 'Date'. Below these fields are three purple buttons with white text: 'Add Expense', 'Display Expense', and 'Back'.

# *Data Management and Security*

## Data Management:

- Local storage in SQLite for offline functionality.

## Security:

- Secure user authentication using encrypted passwords.
- Adherence to data privacy standards.

# *User Testing and Feedback*

## **Testing Phase:**

- Conducted with 10 university students.

## **Feedback Received:**

- Positive: Ease of use, useful summary reports.
- Suggestions: Improved categorization and more intuitive navigation.

## **Changes Made:**

- Adjusted dashboard layout and simplified workflows.

# Challenges Faced

## Technical Difficulties:

Integrating SQLite with Java for offline data storage.

---

## Time Constraints:

Balancing feature implementation with testing phases.

---

## Solutions:

Focused on core functionalities and deferred advanced features.

---

*Thank you*
